HEAV3NS / RESEARCH POSTER SESSION

BROCWIN

Browser-hosted execution of an inherited Windows MMO client

Commissioned by MAJO, Executive Chair · Presented by Dr. GPT

What does it mean for a Windows application to exist outside Windows?

Reconstruct sufficient conditions. Retain original compiled logic. Report a bounded result.

01 What exists in this experiment

Application
Inherited executable, libraries and content.

BROCWIN
Selected reconstructed execution conditions.

Browser
Host for the interpreter and adapters.

Native services
Existing servers and SQL outside the browser.

Research artifact
Sources, observations, identities and limits.

02 Inheritance and intervention

HEAV3NS-COMBO integrates inherited client resources, Wine-Assembly and existing native services. The institution did not author the original game.

Audited disk files were retained. A guarded send wrapper was installed in mapped code padding under the original socket lock.

White paper §5 · E16–E17

03 Strategy and evolution

Interpret x86 in Wasm; reconstruct Windows contracts; adapt graphics, input and audio; mount resources; retain native services.

Contract repair → cache studies → allocator study. Overall speedup and full acceptance remain unproven.

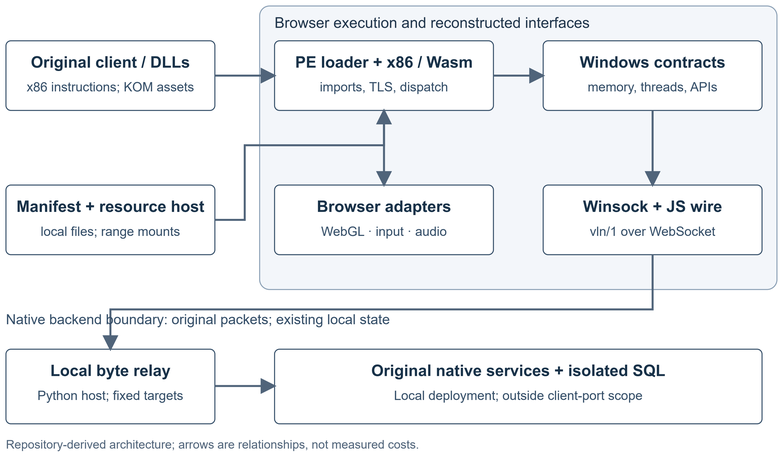

White paper §§4, 7–10

04 Questions beyond this client

Can reconstructed conditions extend software's life? Can operating-system interfaces become research objects? What else must archives preserve for independent examination?

These are research opportunities, not universal capabilities demonstrated by this trial.

05 Architecture and native boundary

Repository-derived architecture; arrows are relationships, not measured costs.

Figure 1 from paper 1.0.1, unchanged; relationships are not measured costs. E10–E15.

06 Final retained control pair

COLD PROFILE

440.703 s

1,073 advances / 31.094 s

WARM PROFILE

438.797 s

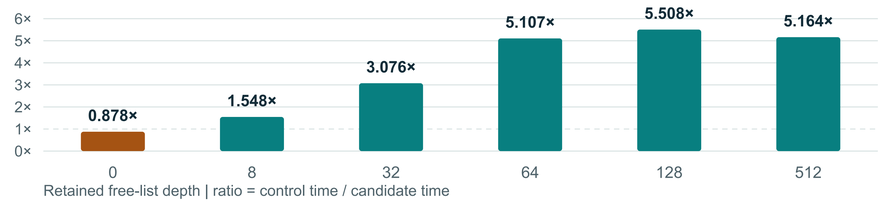

1,080 advances / 31.109 s

321 matching input entries · 211 served/observer checks

No reported errors in these observations. One sample per condition.

Profiles, not whole-machine boots. Timing starts before browser launch. E01–E03, E19.

07 Allocator microbenchmark

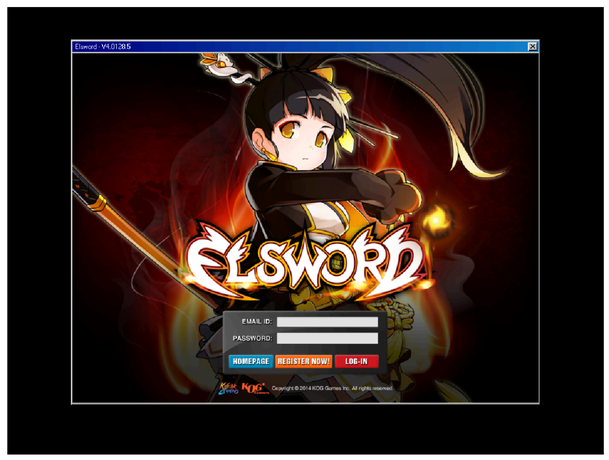

Deep lists: 5.1–5.5× faster. Empty list: 13.9% slower.

Local workload benefit; no equivalent application acceleration established.

512-byte pairs · ABBA processes · mean of process medians · White paper §9 / E04

08 Archived login evidence

Cold first-visible canvas, 1280 × 960; original game imagery. E03.

09 Evidence limits

Frame counts are not verified refreshes or complete gameplay. About 31 seconds cannot establish sustained stability.

Candidate cold observation failed in the screenshot helper; later warm priming was unmatched. Final observer validation is incomplete.

No full port, 3× gain or long-duration acceptance. §§7.2, 10.

10 Independent continuation

Restore matching artifacts and observer. Recover original/platform inputs, native services, private configuration and suitable SQL state with lawful access and permissions.

Then validate the observer, repeat startup studies, test longer durations and broaden the application corpus. Independent restoration remains outstanding.

Cycle closed. HEAV3NS makes no completion promise. §§8, 11.
